

Each year, ECRI Institute investigates hundreds of accidents, near misses, and complaints related to medical technology. Occasionally we identify product design or manufacturing defects. More often, we identify circumstances in which medical technology that is not defective is used in a manner that leads to a safety hazard. Some such use errors are one-time or rare events. Others we see repeatedly even after we have published and publicized a hazard report. The annual Top Ten Healthcare Technology Hazards article and presentation are designed to equip you as a patient safety leader, with the information to conduct a systematic awareness and educational campaign in specific clinical departments to reduce the likelihood that the mistakes of others are repeated at your hospital.
